AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the

application:

Listing of Claims:

Claims 1-11. (Canceled)

12. (New) An electrical machine having at least four exciter poles in the stator and having a

commutator rotor which has a number of slots and pole teeth on its circumference, which

number is greater than the number of exciter poles, having a number of commutator

laminations which is twice as large as the number of pole teeth, and having at least one pair

of stationary carbon brushes which are offset from one another by a pole pitch of the exciter

pole and cooperate with the laminations of the commutator for supplying current to coils

which are each wound onto one of the pole teeth, and the diametrically opposed laminations

are each joined together via contact bridges, the improvement wherein, when there is an even

number of slots, pole teeth and coils the beginning and end of one of the coils disposed on

adjacent pole teeth is connected directly to the laminations adjacent to one another, and the

beginning and end of the other coil is connected via one of the contact bridges to the

laminations adjacent to one another.

Docket No. R.306968 Preliminary Amdt.

13. (New) The electrical machine as recited in claim 12, wherein the coils adjacent to one

another in terms of one direction of rotation are laid with their beginnings and ends on the

laminations that are adjacent to one another in the other direction of rotation.

14. (New) The electrical machine as recited in claim 13, wherein the beginnings and ends of

the adjacent coils are laid in alternation directly and indirectly, respectively, on adjacent

laminations via a contact bridge.

15. (New) The electrical machine as recited in claim 12, wherein the coils disposed on

adjacent pole teeth are each connected directly or indirectly in series with one another via one

of the contact bridges.

16. (New) The electrical machine as recited in claim 13, wherein the coils disposed on

adjacent pole teeth are each connected directly or indirectly in series with one another via one

of the contact bridges.

17. (New) The electrical machine as recited in claim 14, wherein the coils disposed on

adjacent pole teeth are each connected directly or indirectly in series with one another via one

of the contact bridges.

Docket No. R.306968

Preliminary Amdt.

18. (New) The electrical machine as recited in claim 15, wherein the adjacent coils are

connected in alternation directly and via the contact bridge respectively, in series with one

another.

19. (New) The electrical machine as recited in claim 16, wherein the adjacent coils are

connected in alternation directly and via the contact bridge respectively, in series with one

another.

20. (New) The electrical machine as recited in claim 17, wherein the adjacent coils are

connected in alternation directly and via the contact bridge respectively, in series with one

another.

21. (New) The electrical machine as recited in claim 18, wherein all of the coils and contact

bridges are produced continuously with one winding wire.

22. (New) The electrical machine as recited in claim 19, wherein all of the coils and contact

bridges are produced continuously with one winding wire.

23. (New) The electrical machine as recited in claim 20, wherein all of the coils and contact

bridges are produced continuously with one winding wire.

Docket No. R.306968 Preliminary Amdt.

24. (New) The electrical machine as recited in claim 21, wherein the coils and contact

bridges are wound continuously in alternation.

25. (New) The electrical machine as recited in claim 22, wherein the coils and contact

bridges are wound continuously in alternation.

26. (New) The electrical machine as recited in claim 23, wherein the coils and contact

bridges are wound continuously in alternation.

27. (New) The electrical machine as recited in claim 21, wherein at least one of the contact

bridges, and preferably all the contact bridges, are shifted from the commutator side of the

rotor, through its slots, to the side of the rotor facing away from the commutator.

28. (New) The electrical machine as recited in claim 24, wherein at least one of the contact

bridges, and preferably all the contact bridges, are shifted from the commutator side of the

rotor, through its slots, to the side of the rotor facing away from the commutator.

29. (New) The electrical machine as recited in claim 8, wherein the contact bridges shifted

to the side of the rotor facing away from the commutator are wrapped around at least one pole

tooth and at most two pole teeth of the rotor.

Page 14 of 17

Docket No. R.306968 Preliminary Amdt.

30. (New) The electrical machine as recited in claim 21, wherein the beginning and end of

every other coil are laid from the commutator side through adjacent slots to the side of the

rotor facing away from the commutator.

31. (New) The electrical machine as recited in claim 21, wherein all the coils and contact

bridges can be wound continuously by means of automatic winders, in particular by means of

so-called flyers or needles.
